Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                       This sequence represents the coding sequence of human cDNA clone HP10390 which encodes a 20 KD protein with one putative transmembrane domain in the N-terminus. The cDNA was isolated from a human stomach cancer cell line cDNA library. The protein has no homology with any known protein. The protein may be used to raise specific antibodies, as assay reagents as diagnostic tissue markers, for the isolation of cognate receptors, ligands and binding proteins, and as biologically active agents. Nucleotides encoding the protein may be used as primers and probes or antisense molecules, and in gene therapy. Cells transformed with these nucleotides may be used to screen for agonists and antagonists which are potentially useful therapeutically.

This cDNA clone encodes human secretory peptide-9, or 2sig9, variant (see AAW88474). Zsig9 (see also AAW88469) is overexprofuman brain, liver, lung, oesophageal, stomach, colon, rectal, thyroid and lymphoma tumors. Thus, Zsig can be used as an indicator for cancer. Zsig9 cDNA was discovered in a placenta clone from a full-term pregnancy cDNA library which contained a expressed sequence tag (see AAX06971). The invention provides

The Zsig9 gene, or probes derived from it, can be used to determine if Zsig9 gene, or probes derived rom it, can be used as diagnostic agents to determine the presence of Zsig9 can be used as diagnostic agents to determine the presence of Zsig9, and thus the presence of cancer. They can also be labelled with radioisotopes or fused with toxins and used to treat tumours which overexpress Zsig9. Antisense nucleotides derived from Zsig9 cDNA can also be used to inhibit the growth of tumour cells. Zsig9 proteins can be used to enhance the growth or development of the placenta, heart or liver.

                                                                                  Alignment
                                                                                                                                 protein-9, zsig9 that arises due to alternative splicing, allelic variation or silent mutations that result in amino acid changes. This sequence is mapped to the human chromosome 12q15 region. It is overexpressed in tumours. Antagonists, antibodies and antisense nucleotides to zsig9 are useful for detecting and treating tumours. The antagonist may be an antibody or receptor to zsig9 and it may be radiolabelled or fused to a polypeptide toxin. It can be used for down regulating the overexpression of zsig9. The gene sequence can be used as nucleic acid probes to detect RNA encoding zsig9. The zsig9 sequence facilitates improved diagnostic and therapeutic techniques for detecting and treating cancers, especially of the brain, liver, stomach, lymphoma, etc., at an early stage.
                                                                                                            Sequence
                                                                                                                                                                                                                                                                                           The present DNA sequence is a gene encoding the variant of the secretory

```
Human proteins with transmembrane domains, involved in control of cell proliferation and differentiation, useful for treating e.g. cancer or inflammation –
```

Claim 4; Page 106-107; 114pp; English.

This sequence represents the human cDNA clone HP10390 which encodes a 20 kD protein with one putative transmembrane domain in the N-terminus. The cDNA was isolated from a human stomach cancer cell line cDNA library. The protein has no homology with any known protein. The protein may be used to raise specific antibodies, as assay reagents, as diagnostic tissue markers, for the isolation of cognate receptors, ligands and binding proteins, and as biologically active agents. Nucleotides encoding the protein may be used as primers and probes or antisense molecules, and in gene therapy. Cells transformed with these nucleotides may be used to screen for agonists and antagonists which are potentially useful therapeutically.

                                                                                   The invention relates to modulators of a cancer-related genes. Also described are: (1) processes for identifying an anti-neoplastic agents comprising contacting a cell exhibiting neoplastic activity with a compound first identified as a cancer related gene modulator, and detecting a decrease in the neoplastic activity. (2) a process for determining the cancerous state of a cell by determining an increase in the level of expression of at least one gene, where an elevated expression relative to a known non-cancerous cell indicates a cancerous state or potentially cancerous state. The anti-neoplastic agent is useful for treating cancer or for protecting an animal against cancer. The immunogenic composition is also useful for treating cancer in an animal, where the composition elicits the production of cytotoxic T lymphocytes specific for the immunogenic composition. Preferably, the animal is a human. The cancer-linked genes and polypeptides are also useful as targets for cancer therapy or chemotherapy. The present sequence represents a cancer-linked gene located on chromosome 12, which encodes transmembrane protein 4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      11-OCT-2000;

The a fusion protein having an antigen protein fused to the C-terminal side (extracellular) of a transmembrane domain protein (the N-terminal side of which is intracellular), and then isolating and purifying the antibody from the animal. The antibodies can be used as drugs, vaccines, diagnostic reagents and laboratory reagents. The present sequence encodes a polypeptide, designated Hp10390, which was used in the course of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Kato
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antibody preparation by inoculation of an animal with a vector expressing a fusion protein of an antigen on the C-terminal side transmembrane domain for use as drugs, diagnostic reagents and

                                                                                                                    and for treating ovarian cancer in a patient. An antigen presenting cell that expresses the sequences is useful for treating ovarian cancer by incubating CD4+ and/or CD8+ T cells isolated from a patient. The T cells can then be proliferated and administered to the patient to inhibit the development of cancer. The DNA sequences are useful as probes or primers for nucleic acid hybridisation, to direct expression of a polypeptide in appropriate host cells. Detecting the presence of a cancer in a patient involves obtaining a biological sample from the patient, contacting the biological sample with an agent that binds to the protein, detecting the amount of protein that binds to the agent, comparing the amount of protein that binds to the agent, comparing the presence of cancer. Sequences ABK09464-ABK09802 represent PCR primers and CDNA molecules encoding ovarian tumour proteins of the invention.
                                                                                                                                                                                                                                                                                                        The
                                                                                                                                                                                                                                                                      polypeptide comprising a portion of an ovarian tumour protein. The sequences of the invention are useful for stimulating an immune reand for treating ovarian cancer in a patient.
                                                                                                                                                                                                                                                                                                                                                                                                                              Xu J,

CC The invention relates to nucleic acid sequences (AAX22111 to AAX22134) CC encoding human secreted proteins (AAY01135 to AAY01138). The secreted CC protein gene sequences are deposited with the ATCC under deposit number CC ATCC 209118. Host cells comprising recombinant vectors containing the CC acid sequences are used for the recombinant production of the CC secreted proteins. The polynucleotide and amino acid sequences are useful CC conditions e.g. by protein or gene therapy. Pathological conditions can CC sample or by determining the amount of the new polypeptides in a CC polynucleotides. Specific uses are described for each of the polynucleotides, based on which tissues they are most highly expressed CC in, and include developing products for the diagnosis or treatment of CC cancer, tumours, developmental abnormalities and foetal deficiencies, autoimune diseases, lymphomas, Alzheimer's and cognitive disorders, cancer, fumours, developmental abnormalities and foetal deficiencies, cancer, tumours, developmental abnormalities and foetal deficiencies, CC schizophrenia, immunological disorders, immune deficiency diseases. CC (AIDS), mood disorders, respiratory disorders, atthritis, asthma, CC osteoporosis, metabolic disorders, cardiovascular disorders, endoorine contentifying their binding partners. The polypeptides are also useful gene encoding a human secreted protein (see descriptor line for gene and clone identification).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated human genes and the secreted polypeptides they encode -useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, immune deficiency diseases or blood disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 4; Page 117; 179pp; English

CC AAS21244-AAS21518 encode for novel human secretory and transmembrane CC PRO polypeptides. The PRO polypeptides are useful to detect other CPRO polypeptides, to link bioactive molecules to cells expressing CC PRO polypeptides, to modulate biological activities of cells expressing CC PRO polypeptides, and to detect the presence of mammalian lung, colon, CC breast, prostate, rectal, cervical or liver tumours by comparing PRO CC polypeptide expression in a cell sample to that in a control sample. CC Some of the 275 sequences are also useful to stimulate the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, the CC proliferation or differentiation of chondrocytes, the proliferation or CC gene expression in pericyte cells, the release of proteoglycans from CC cartilage, the proliferation of inner ear utricular supporting cells or of T-lymphocytes, the proliferation of endothelial cells. Some of the PRO polypeptides may modulate glucose or free fatty acid uptake by skeletal muscle cells or by adipocytes; or inhibit binding of A-peptide CC molecules involved in binding interactions. The polynucleotides encoding CC PRO polypeptides can be used to generate probes, antisense RNA/DNA, creations of the process of the process of the process of the process of the proposities can be used to generate probes, antisense RNA/DNA, creating the process of the proposities can be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Isolated, secretory and transmembrane PRO polypeptide used to detect other PRO polypeptides, link bioactive molecules to cells expressing PRO polypeptides, and detect the presence of mammalian tumours e.g.

                                                                                                                                                                                                                                                                         AAX97813-X97906 represent extended cDNA's which encode novel human secreted proteins (see AAY36129-Y36222) and which have cytostatic, thrombotic and osteopathic activity. The extended cDNAs can be used to express secreted proteins or parts of them or to obtain antibodies capable of binding to the secreted proteins. They may also be used in diagnostic, forensic, gene therapy and chromosome mapping procedures. Uses also include design of expression vectors and secretion vectors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DB:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                US-10-082-502-17 (1-182) x AAX06970
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This cDNA clone encodes novel mouse secretory peptide-9, or Zsig9 (See AAW88476), an orthologue of novel human Zsig9 (see AAW88469). CC Human Zsig9 is overexpressed in a number of tumours including CC brain, liver, lung, oesophageal, stomach, colon, rectal, thyroid CC and lymphoma tumors, and thus can be used as an indicator for CC cancer. The invention provides polynucleotides (see AAX06968-70) cc encoding Zsig9 polypeptides (see AAW88469-77) including mature polypeptides, other processed forms, variants and the mouse orthologues. The Zsig9 gene, or probes derived from it, can be contrologues. The Zsig9 gene, or probes derived from it, can be cused to determine if Zsig9 is present on chromosome 10, and if a mutation has occurred. Antibodies raised against Zsig9 can be cused as diagnostic agents to determine the presence of Zsig9, and thus the presence of cancer. They can also be labelled with cradioisotopes or fused with toxins and used to treat tumours which overexpress Zsig9. Antisense nucleotides derived from Zsig9 con Connections can also be used to enhance the growth or development of the proteins can be used to enhance the growth or development of the proteins can be used to enhance the growth or development of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 1069

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ş
                                                       The present DNA sequence is an ortholog encoding the secretory protein-9, zsig9 derived from mouse. It is overexpressed in tumours. Antagonists, antibodies and antisense nucleotides to Zsig9 are useful for detecting and treating tumours. The antagonist may be an antibody or receptor to zsig9 and it may be radio-labelled or fused to a polypeptide toxin. It can be used for down regulating the overexpression of Zsig9. The gene sequence can be used as nucleic acid probes to detect RNA encoding Zsig9. The zsig9 sequence facilitates improved diagnostic and therapeutic techniques for detecting and treating cancers, especially of the brain, liver, stomach, lymphoma etc., at an early stage.

(GEMY) GENETICS INST INC.

Jacobs K, McCoy JM, Lavallie ER, Collins-Racie LA, Evans C; Merberg D, Treacy M, Agostino MJ, Bowman MR, Spaulding V, Wong GG; Clark HF, Fechtel K, Howes SH, Resnick RJ, Gulukota K, Graham JR; WPI; 2002-179322/23.

Six hundred and twenty three polynucleotides derived from a variety of human tissue sources which encode secreted proteins, useful for treating immune deficiencies and disorders such as autoimmune disorders

Claim 1; Page 297; 393pp; English.

The present invention relates to the isolation of novel cDNA sequences which encode human secreted proteins. The cDNA sequences have been derived from a variety of human tissues. The invention also provides a method for producing proteins from these polynucleotide sequences. The proteins are useful for identifying compounds that modulate their activity and production. The sequences of the invention are useful for treating diseases such as hyperproliferative disorders (e.g. cancer), immune deficiency disorders (e.g. severe combined immunodeficiency (SCID)), autoimmune disorders (e.g. multiple sclerosis), blood disorders (e.g. thrombocytopaenia), inflammatory disorders (e.g. arthritis), infectious disorders (e.g. hepatitis), allergic conditions (e.g. asthma), neurodegenerative disorders (e.g. haemophilia), and tumours. The polynucleotide sequences of the invention are also useful in gene therapy. ABK35610-ABK3623 represent the cDNA sequences of the invention that encode for novel human constitutions.

                                                                                   Local Similarity:
                                                                                                                                                                AAX97813-X97906 represent extended cDNA's which encode novel human secreted proteins (see AAY36129-Y36222) and which have cytostatic, thrombotic and osteopathic activity. The extended cDNAs can be used to express secreted proteins or parts of them or to obtain antibodies capable of binding to the secreted proteins. They may also be used in diagnostic, forensic, gene therapy and chromosome mapping procedures. Uses also include design of expression vectors and secretion vectors.
                                                                                                                                                                                                                                           Example 28; Page 194-195;
